In our new single-plate approach, the interaction of the plate with the underlying mantle is exclusively represented by tractions from mantle flow models that contain active and passive tractions. It has also been hypothesized that the patterns found in sand dunes reflect maximum aeolian transport [ 57 ], i. The most commonly proposed mechanism to explain this is an electrodynamic coupling between tides at E region altitudes and ion drifts at F region altitudes, but multiple-mechanisms involving electrodynamic and electro-chemical effects may be involved England et al. Anexampletoexplainhisapproachisastraight-rollingwheel.This theory can also provide the explanation of the formation of rings, and in general of all the plane celestial systems in rotation, that we observe in our universe. That point lies on the circle drawn from the geometric center of the orbit and the perpendicular Q, carried out on the diameter, passes

through the point S.
