These reductions in activation also extend to task-based functional connectivity: for example, during finger tapping, individuals with ASD had decreased FC between the Language cerebellum and primary motor cortex, thalamus, Language supplementary motor area Mostofsky et al. It is suggested with Marvel and Desmond that this certainly included the transition from the strongly motor-driven visual-spatial working memory mostly dorsal dentate toward the more cognitively driven phonological silent speech-related component of working memory mostly ventral dentate which would guide those motor systems in increasingly adaptive ways.
